BURAK ERDEMCİ

AI Tooling & Game Developer

Eskişehir, Türkiye · Open to relocation · erdemciburakemre@gmail.com · github.com/BurakErdemci · linkedin.com/in/burak-erdemci · burakerdemci.com

I build the tooling that makes AI agents usable in production: multi-agent orchestration, MCP servers and cross-platform desktop apps. I set the architecture and the constraints, hand most of the implementation to agents, and judge the result by the trace it leaves rather than the report it writes. I also ship game work in Unity and C#.

PROJECTS

Gamachine — agentic development studio for Unity Jan 2026 – present

Python, FastAPI, Electron, React, TypeScript, MCP

– Brought seven CLI coding agents (Claude Code, Codex, Copilot, Cursor, OpenCode, Kimi, agy), eight cloud providers and local Ollama into one interface; selecting a CLI writes its MCP configuration automatically.

– Built live Unity Editor control over MCP: GameObject operations, console reads, play mode, and sending input into the running game.

– Designed the approval gate around risk: file deletion and terminal commands outside the safe list always raise a card, while low-risk paths stay exempt so the gate does not train reflex approval.

– Shipped packaged builds for Windows and macOS (arm64). 337 commits, ~1,550 tests (1,161 pytest on the backend, 407 Vitest on the frontend).

Context Police — auditor for AI coding-agent memory Aug 2026 – present

Tauri, TypeScript, Python, SQLite, Git

– Built an auditor that catches agent memory notes going stale: contradiction detection across notes, and anchor drift measured against the git history.

– Chose a design with no delete operation; a decayed note is marked superseded, which drops the cost of a false flag to zero and keeps the tool's own error rate measurable.

– Moved the audit out of the live session into a clean context and framed it as a measurement task rather than a recall task. 211 commits.

codex-delegate — Claude Code plugin Jul 2026 – present

Python, Codex CLI, Git worktree

– Built parallel Codex worker lanes; each worker runs in its own worktree pinned to a known commit while the architect writes the spec and verifies the result against it.

– Made every finding carry a runnable proof; a finding that will not reproduce is not acted on.

Ristorante Stellato — full-stack reservation system Nov 2025 – Aug 2026

Next.js, React, TypeScript, MongoDB

– Built an interactive floor plan in Three.js with real-time availability checks.

– Added a NextAuth v5 admin panel, TR/EN/IT localisation, PWA support and IP-based rate limiting; 53 tests. Live on Vercel.

Workday Loop — Unity 2D narrative game Jan – Apr 2026

Unity, C# · *team project; my role: level design and narrative*

– Designed the two-ending narrative structure and the level flow around player choice; published on itch.io.

OPEN SOURCE

CoplayDev/unity-mcp — MCP server for Unity; two pull requests open, under review.

– **manage_sprite (#1338):** added 2D sprite sheet animation, which upstream had no support for — sheet slicing, AnimationClip generation and AnimatorController wiring. 24 files, +3,859 lines; all 13 review findings resolved.

– **Animator resolution fix (#1337):** the Animator component sits on the model root, a child of the target object, so the tool failed on the most common rig setup. 10 files, +667 lines.

TECHNICAL SKILLS

Languages: Python, TypeScript, C#

AI / Agents: Multi-agent orchestration, MCP server development, LLM API integration

Backend: FastAPI, ASP.NET Core, REST APIs

Frontend: React, Next.js, Tailwind CSS

Desktop: Electron, Tauri

Databases and tools: SQLite, MongoDB, PostgreSQL, Git, Docker, Unity

EDUCATION

Eskişehir Technical University — Computer Programming (associate degree) expected: Jun 2027

LANGUAGES

Turkish (native) · English (upper-intermediate)
